

COMPENSATING CONSUMPTION

In 2030, graveyards are full. We need space to bury the dead, since dissolving is still a bit frowned upon. A special drone will scout a spot for you! In any natural areas, it will scan the vegetation and compare your bodily data, to see where your nutrients would have most impact. So, after your death, you'll be able to compensate and add value to the earth (rather than add toxins to the soil at graveyards. You can compensate your (over) consumption.
