# Problem

*Low orthopedic shoe wear by at-risk diabetes patient (22 – 36%). (Bus et al., 2013)*

## **Objective measurement studies**

Waaïjman et al., 2013	Ehrman et al., 2018	Lutjeboer et al., 2020
<b>N = 107</b>	<b>N = 26</b>	<b>N = 11</b>
<b>9.4 ± 4.4 h/day</b>	<b>4.2 ± 3.6 h/day</b>	<b>6.42 h/day</b>
<b>Period = 7 days</b>	<b>Period = 133 days</b>	<b>Period = 84 days</b>

## **Goal 1: Objective long-term measurements**

*No-clear factors associated with shoe wear using objective measurements (Jarl et al., 2016)*

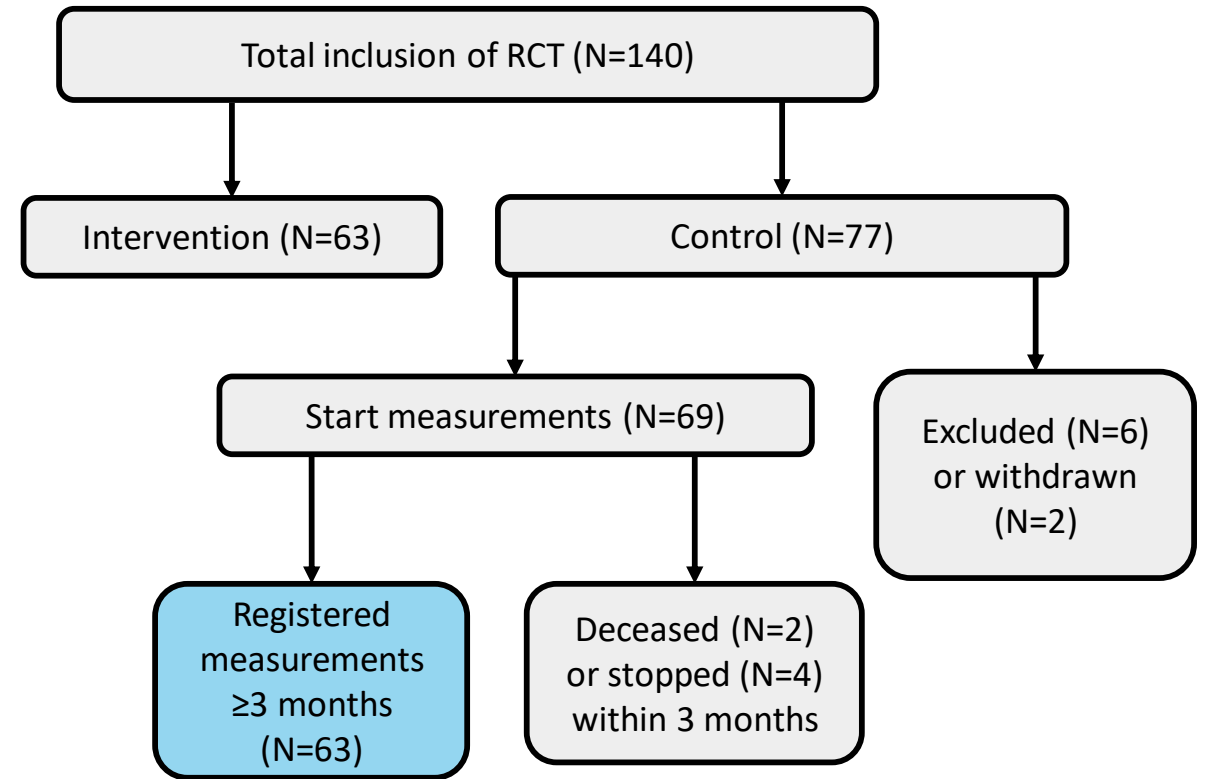

**Goal 2: Investigate factors associated with orthopedic shoe wear**

# Method

## Participants

**Inclusion** Diabetes type 1 or 2  
≥18 years  
IWGDF 2019 Risk Categories 1-3  
Receiving orthopedic shoes

**Exclusion** Current foot ulcer  
Active Charcot's neuro-arthropathy  
Foot infection  
Unable to walk  
Unable to read or understand study instructions

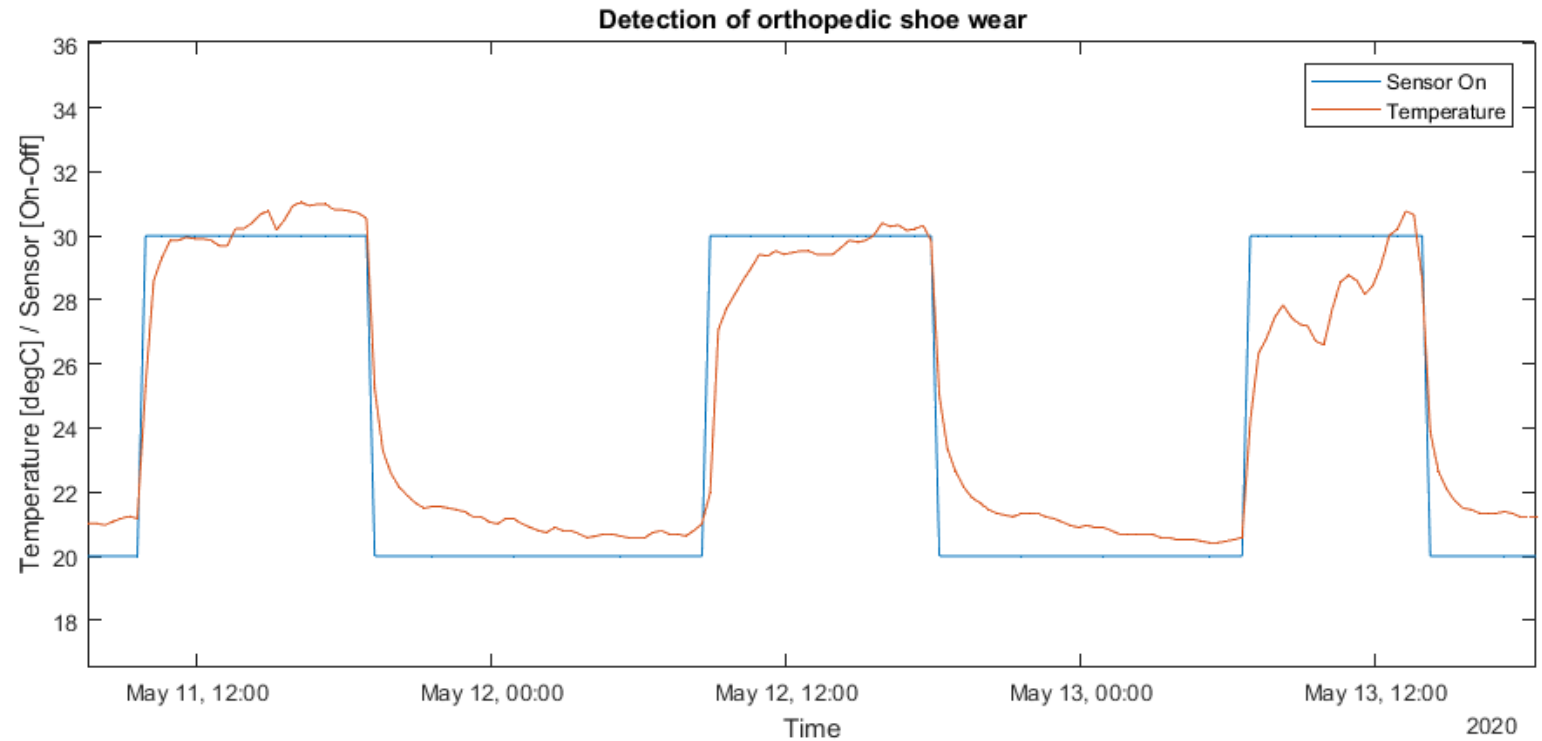

# Method

## Instrumentation

*Orthotimer temperature sensor*

*Adapted Groningen algorithm (Lutjeboer et al., 2018)*

# Method

## Definitions

***Mean wearing time:*** *Mean hours of orthopedic shoe wear per day*

***Adherence:*** *defined as percentage total steps taken in orthopedic shoes (Waijman et al., 2013)*

***Estimated adherence:*** *Mean wearing time as a percentage of 16 active hours per day. (Waijman et al., 2013)*

# Results

## *Objectively measured wearing time*

Mean (SD) daily wearing time: **8.06 (6.08) hours/day**

Mean valid days per subject: **334,8 days**

Waaijman  
et al., 2013

**N = 107**

**9.4 ± 4.4 h/day**

**Period = 7 days**

Ehrman et  
al., 2018

**N = 26**

**4.2 ± 3.6 h/day**

**Period = 133 days**

Lutjeboer  
et al., 2020

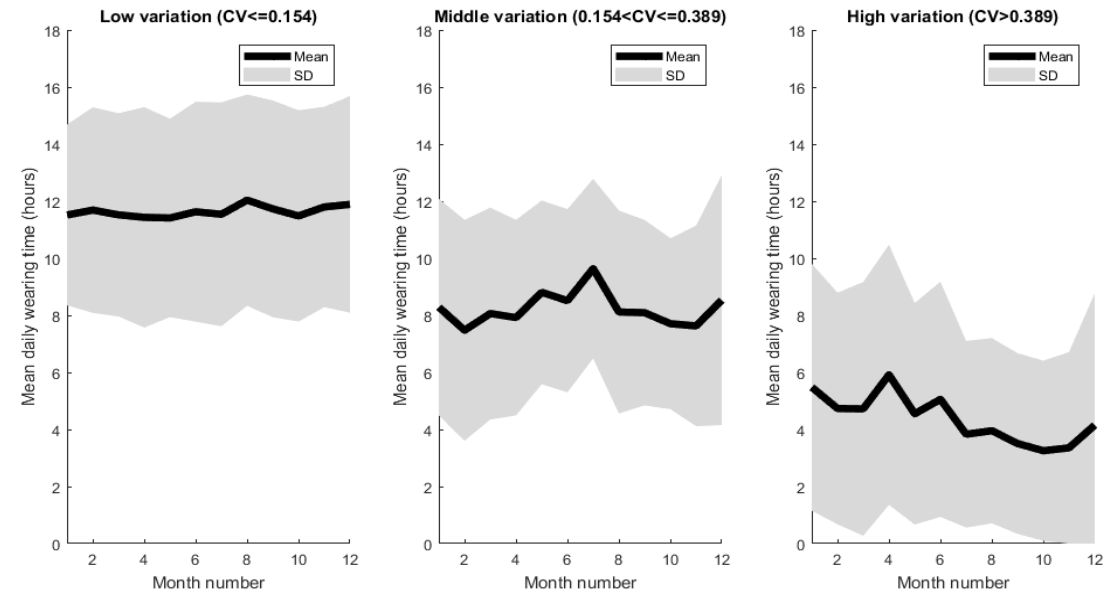

**N = 11**

**6.42 h/day**

**Period = 84 days**

# Results

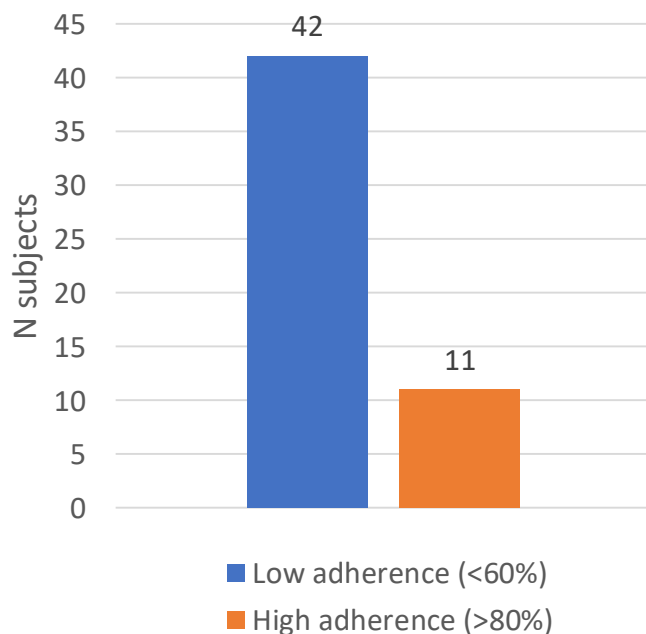

- *Large differences in fluctuation*
- *Subdivision based on variation*
- *Large variation means low wear*

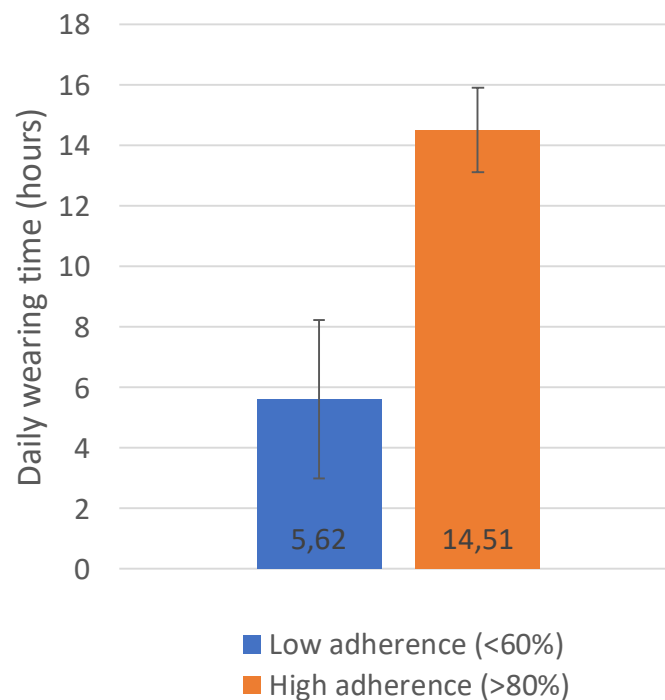

# Results

## High vs Low wear

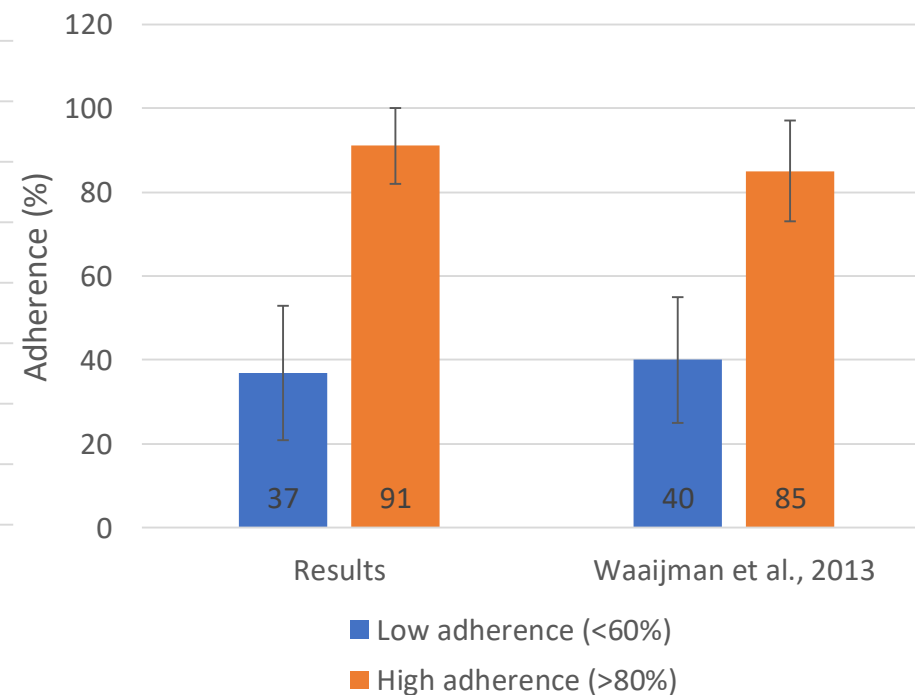

N subject in low-vs-high adherence

Mean daily wear (hours)

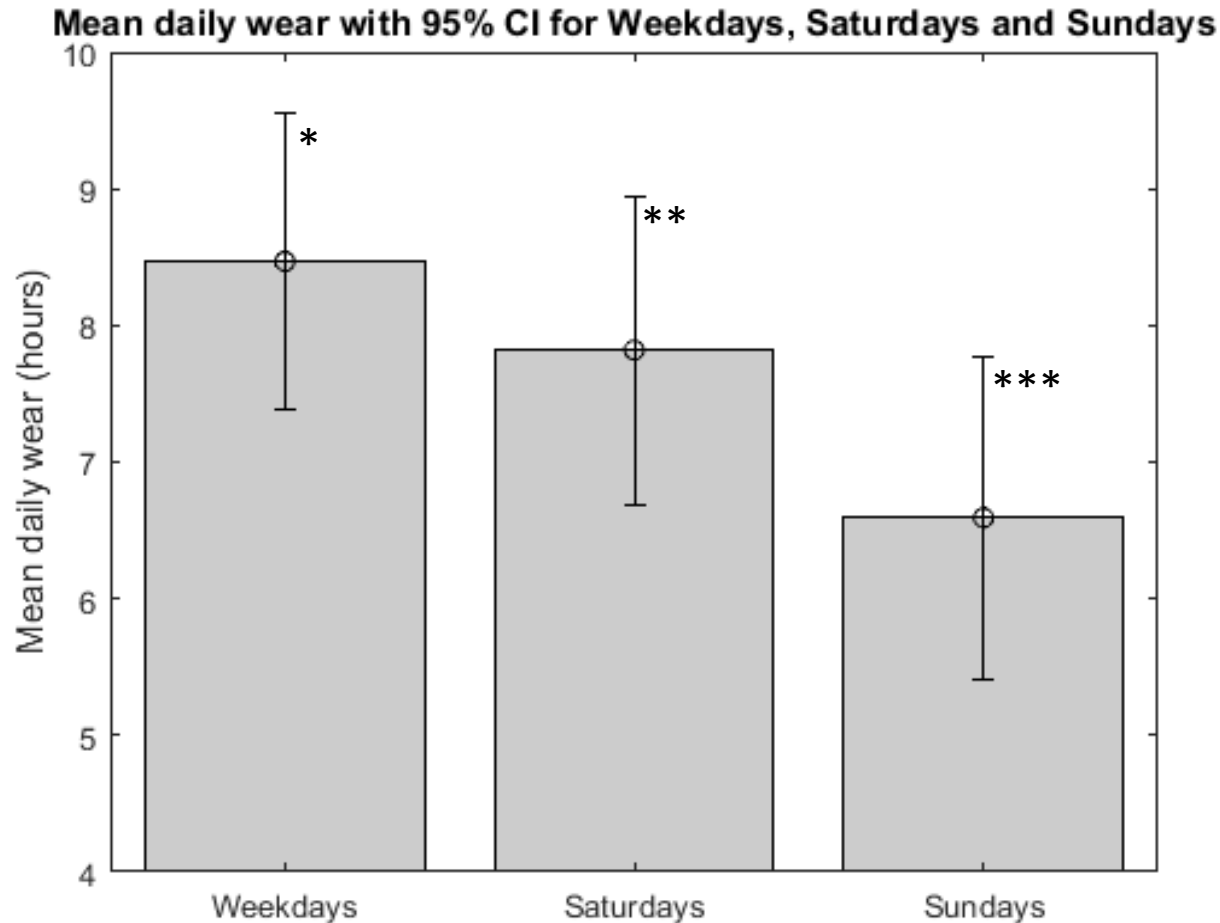

Estimated adherence compared to Waaijman et al., (2013)

# Results

## Days of the week

*\*significant difference from Saturdays & Sundays ( $p < 0.001$ )*

*\*\* significant difference from Weekdays & Sundays ( $p < 0.001$ )*

*\*\*\* significant difference from Weekdays & Saturdays ( $p < 0.001$ )*

*N.B. 95% CI is no gauge of significance in this case.*

# Results

## *Univariate + multiple regression*

*demographics, diabetes-related characteristics & shoe usability*

*Few factors show significant effects on daily wearing time.*

*Only **education level** in multiple regression ( $p=0.01$ )*

*Demographics & diabetes-related characteristics cannot predict orthopedic shoe wear (Jarl et al., 2016, Jarl et al., 2020) ( $R^2 = 0.20$ )*

*Shoe usability factors also show limited predictive value ( $R^2 = 0.14$ )*

# Conclusion & Discussion

- *Mean daily wear of 8.06 (6.08) hours/day*
- *Large differences between participants*
- *Limited predictive value in studied factors*
- *High fluctuations in wear could predict overall wear time*
- ***Shoe wearing time should be measured objectively and individually***

# Further research

- *Objectively measuring adherence*
- *Effect of motivational interviewing on long-term adherence*

*Orthotimer*

*Activity Tracker (MisFit)*
