

Remote Control of Experiments (RCE)(202001416)

Information session

Jeroen W.J. Verschuur

University of Twente

December 16th; 2020

- 1 Introduction
- 2 Content of the course
 - Introductory problems
 - Computer Interfacing with DAQmx
 - Remote system: cRIO
 - Remote system: myRIO
 - Sensors & Actuators
- 3 Example
- 4 Final Assignment
- 5 Learning outcomes, Grading and Scheduling
- 6 end

Motivation

- Modern techniques for an engineer: Control via computer.
- Inspired by the Covid-19 virus: Work remote!
- Implemented in own experiments in the SLT-laboratories.
- Experimental counterpart of Computational Physics.

The context

- Hardware:
 - Your laptop.
 - An embedded system, with interface to the real world.
 - A set of sensors and actuators
- Software:
 - NI LabVIEW: a graphical programming language.
 - A large library of functional objects.
 - A measurement explorer application.
 - optional FPGA-programming.
- Communication:
 - Network
 - Bus: i2C or SPI
 - USB

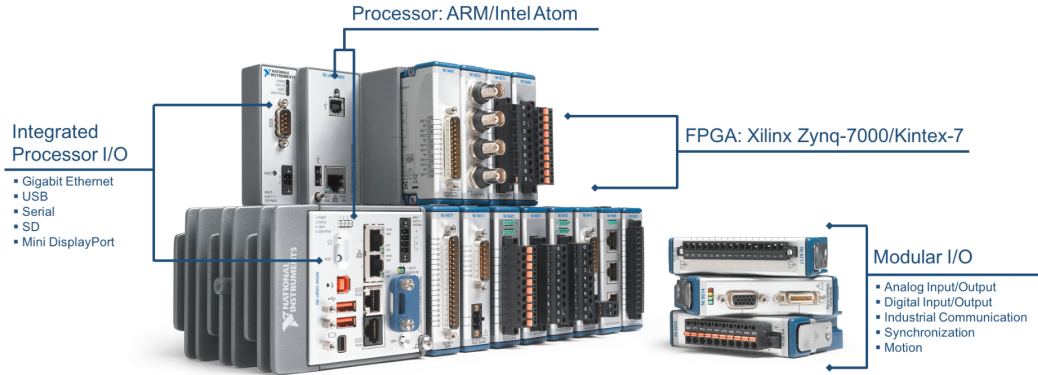

Introductory problems

- Introduction to Graphical Programming
- Realize basic functions in VI's
- programming structure:
 - Front panel: controls and indicators
 - Wire panel: graphical programming
 - Connections
 - Loops
 - Cases
 - Data structures
- Interfacing with the real world

DAQmx

- Introduction DAC, ADC and DIO
- Concept of local limited intelligence and control from program
- Explore structure of interface
- Explore and test limits of the interface hardware – software
 - timing
 - resolution
 - control

The cRIO system

Figuur: The cRIO system.

The cRIO system

- Introduction to cRIO system: embedded computer + FPGA
- Bus-rack with dedicated interface modules
- Real-time programming
- Communication between computer and embedded CPU
- Principles of distributed computing and control
- FPGA programming (limited)

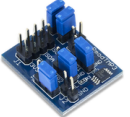

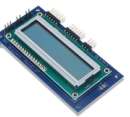

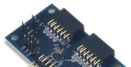

Remote system: myRIO

- Introduction to the myRIO system
- Explore myRIO and parallels with the cRIO
- Real-time programming
- Communication between computer and myRIO
- FPGA programming (limited)
- myRIO – smart-sensor/actuator communication (I2C-protocol)

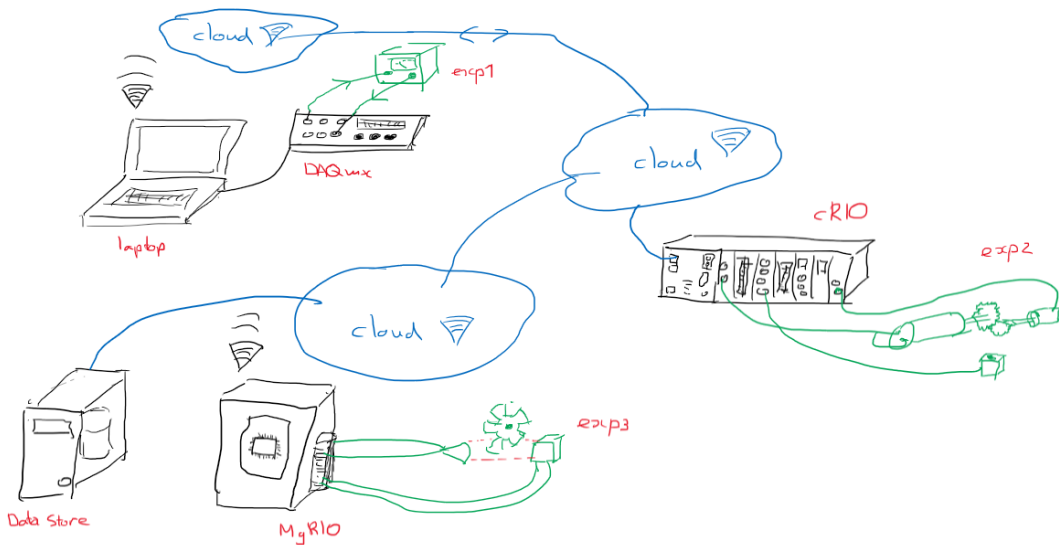

Pmod Modules with I2C protocol

					
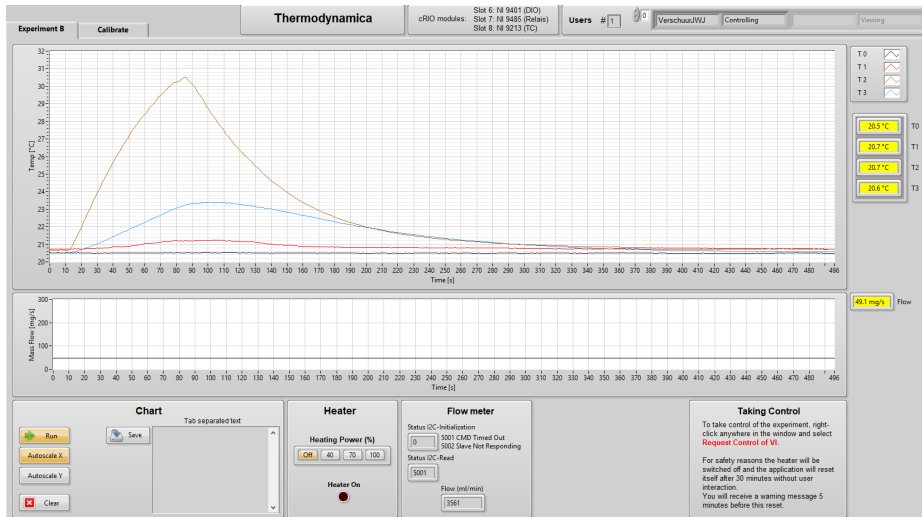

Pmod AD2: 4-channel 12-bit A/D Converter \$18.99	Pmod ACL: 3-axis Accelerometer \$14.99 ★★★★★	Pmod GYRO: 3-axis Digital Gyroscope \$19.99	Pmod TMP3: Digital Temperature Sensor \$6.99 ★★★★★	Pmod RTCC: Real-time Clock / Calendar \$8.99	Pmod CLS: Character LCD with Serial Interface \$29.99
ADD TO CART	ADD TO CART	ADD TO CART	ADD TO CART	ADD TO CART	ADD TO CART
					
Pmod TMP2: Temperature Sensor \$14.99 ★★★★★	Pmod IA: Impedance Analyzer \$38.99	Pmod AMP3: Stereo Power Amplifier \$9.99	Pmod PMON1: Power Monitor \$9.99	Pmod HYGRO: Digital Humidity and Temperature Sensor \$14.99	Pmod CDC1: Capacitive Input Buttons \$7.99
ADD TO CART	ADD TO CART	ADD TO CART	ADD TO CART	ADD TO CART	ADD TO CART
					

Use of sensors in real-time programming

- Explore smart-sensor modules: Pmod
- Explore communication protocols between myRIO and Pmod's
- Realize a simple Pmod project
- Explore the limits of the system
 - Timing and speed issues
 - Resolution
 - Controllability

Schematic Measurement & Control configuration

Final Assignment

The final assignment:

- Short assignment (2.5 EC variant) or Extended assignment (5 EC variant)
- You can propose your own final assignment
- Combinations with work for your Bachelor assignment are possible
- We have a collection of possibilities for a final assignment (mainly short ones)

Learning outcomes

Computer as tool:

- Control of laboratory equipment.
- Computer interfacing with experiments for measurements (automation).
- Analysis and presentation of measurement data.
- Set up measurement-control-steer loops.

Programming environment LabVIEW:

- Graphical programming – diffusing the hardware–software interface.
- Design and realise a functional user interface to control an experiment.
- Communication & synchronisation of processes.
- Set-up distributed control & measurement structures.

Engineering:

- Design a (remote) measurement-control system.
- Realise the system using the appropriate hardware and software.
- Test the system, make a performance report and compare with the design criteria.

Scheduling & Grading

Scheduling:

- Choose between 2.5 EC (8 x 4h) and 5 EC (16 x 4h) variant
- Sessions scheduled in cooperation with coordinator and availability of lab
- The two versions differ in the extend of the final assignment

Grading:

- Compact journal of the introductory problems
- Report on the final assignment
- Discussion of the work and results

end
